Singular perturbated problems and Julia package in optimal control.

Heads:

- Olivier Cots, Assistant Professor, Université de Toulouse, INP-ENSEEIHT, APO Team of IRIT, http://cots.perso.enseeiht.fr.

Laboratory: CIMI & INP-ENSEEIHT-IRIT.

Keywords: Optimal control, Singular perturbation, Numerical optimization, git, JULIA language.

3rd year internship. Duration of 6 months and salary of 600 euros per month.

Context. This internship is a part of the CIMI project: Singular perturbated problems [5, 3, 7] and JULIA [1] package in optimal control. The objectives of this project is to solve numerically with a good precision singular perturbated optimal control problems and to develop a package in julia for solving optimal control problem by direct and indirect methods with a good connexion between theses methods. This last point will be integrated in the ADT project of INRIA, named Control Toolbox (CT).

Work to do.

- Test softwares in JULIA and MATLAB for solving singular perturbated optimal control problems on simple examples.
- Develop in JULIA an interface to the HamPath [4, 6] code developed by the APO team of IRIT.
- Integrate this work in the NUTOPY [2] project.

Ability and knowledge.

- Good bases in applied mathematics.
- Good bases in programmation. This project will be made in a git environment with the generation of the documentation, the unitary tests and continuous integration.
- Bases in MATLAB or JULIA.

Future. This internship could be continued in a PhD. For this, the student would candidate to PhD grant of CIMI and IRIT.
