L1-Wasserstein and L2-Wasserstein distances

Definition

Let μ and ν be two probability measures on \mathbb{R}^{2d} . We define

$$\mathcal{W}(\mu, \nu) = \inf_{\Gamma \in \Pi(\mu, \nu)} \int |x - \tilde{x}| + |v - \tilde{v}| \Gamma(d(x, v) d(\tilde{x}, \tilde{v}))$$

$$\mathcal{W}_2(\mu, \nu) = \left(\inf_{\Gamma \in \Pi(\mu, \nu)} \int |x - \tilde{x}|^2 + |v - \tilde{v}|^2 \Gamma(d(x, v) d(\tilde{x}, \tilde{v})) \right)^{1/2}$$

where the infimum is chosen on all couplings of μ and ν .

Theorem

Let $U \in \mathcal{C}^1(\mathbb{R}^d)$ satisfy the previous assumption. There is an explicit $c^W > 0$ such that, for all $W \in \mathcal{C}^1(\mathbb{R}^d)$ satisfying $L_W < c^W$, there is an explicit $\tau > 0$ such that for all probability measures ν_0^1 and ν_0^2 on \mathbb{R}^{2d} with a finite second moment, there are explicit constants $C_1, C_2 > 0$ such that for all $t \geq 0$,

$$\mathcal{W}_1(\bar{\nu}_t^1, \bar{\nu}_t^2) \leq e^{-\tau t} C_1, \quad \mathcal{W}_2(\bar{\nu}_t^1, \bar{\nu}_t^2) \leq e^{-\tau t} C_2$$

where $\bar{\nu}_t^1$ and $\bar{\nu}_t^2$ are the probability densities of solutions of (NL) with respective initial distributions $\bar{\nu}_0^1$ and $\bar{\nu}_0^2$.

Furthermore, we have existence and unicity of - as well as convergence towards - a stationary solution.

Theorem

Let $C^0 > 0$ and $a > 0$. Let $U \in \overline{C^1}(\mathbb{R}^d)$ satisfy the previous assumption. There is an explicit $c^W > 0$ such that, for all $W \in C^1(\mathbb{R}^d)$ satisfying $L_W < c^W$, there exist explicit $B_1, B_2 > 0$, such that for all probability measures ν_0 on \mathbb{R}^{2d} (under some initial moment assumption depending on C^0 and a) and for all $t \geq 0$,

$$\mathcal{W}_1\left(\nu_t^{k,N}, \bar{\nu}_t^{\otimes k}\right) \leq \frac{kB_1}{\sqrt{N}}, \quad \mathcal{W}_2^2\left(\nu_t^{k,N}, \bar{\nu}_t^{\otimes k}\right) \leq \frac{kB_2}{\sqrt{N}},$$

for all $k \in \mathbb{N}$, where $\nu_t^{k,N}$ is the marginal distribution at time t of the first k particles $((X_t^1, V_t^1), \dots, (X_t^k, V_t^k))$ of an N particle system (PS) with initial distribution $(\nu_0)^{\otimes N}$, while $\bar{\nu}_t$ is the probability densities of (NL) with initial distribution ν_0 .
